```

밁 Ś

double-stranded cDNA was size selected, ligated to Eco RI adapters (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of a modified pT7T3 vector (Pharmacia). Library went through one round of normalization to a Cot = 5. Library constructed by M.Fatima Bonaldo. This library was constructed from the same fetus as the fetal lung library, Soares fetal lung NDHL19W."

strand cDNA was primed with a Not I - oligo(dT) primer [5'

/note="Organ: prostate; Vector: pT7713D-Pac (Pharmacia)
with a modified polylinker; Plasmid DNA from the
normalized library NCI CGAP pr22 was prepared, and 8s
circles were made in vTtro. Following HAP purification,
this DNA was used as tracer in a subtractive hybridization
reaction. The driver was PCR-amplified CDNAs from a pool
of 5,000 clones made from the same library (cloneIDs
985608-986759, 1101192-1101959, and 1217928-1220615).
Subtraction by Bento Soares and M. Patima Bonaldo. " degraded by NaOH treatment and cDNA was amplified by PCR reaction. The PCR products were digested with SfiI and cloned into DraIII- digested pMEIBS-FL3 vector. The obtained cDNA vectors were used for transformation of compatent cells E. coli ToplOF' by electroporation method. The cDNA libraries constructed by this method are full-length enriched cDNA library." /dev\_stage="adult" /lab\_host="DH10B" /mol\_type="mRNA" /db\_xref="taxon:9606" organism="Homo sapiens" /mol\_type="mRNA" sex="male" clone="IMAGE:2112934" 295 41.00 100.00% 100.00% 100.00% Length: Matches: Conservative: ۵ Mismatches: Indels: Ph.D. Anatomy Project (CGAP), 0000833 Sequencing Center

/UI-E-CKI is a normalized cDNA library containing the
following tissue(s): Retina Foveal and Macular. The
library was constructed according to Bonaldo, Lemnon and
Soares, Genome Research, 6:791-806, 1996. First strand
cDNA synthesis was primed with an oligo-dT primer
containing a Not I site. Double stranded cDNA was ligated
to an EcoR I adaptor, digested with Not I, and cloned
directionally into pT7T3-Pac vector. The oligonucleotide
used to prime the synthesis of first-strand cDNA contains
a library tag sequence that is located between the Not I
site and the (dT)18 tail. The sequence tag for this
library is GTCC. This library was created for the program,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Location/Qualifiers

/note="Organ: Placenta; Vector: pT7T3-Pac (Pharmacia) with a modified polylinker; Site 1: EcoR I; Site_2: Not I; NCI_CGAP_Pl3 is a subtracted cDNA library constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tags for this library are GA, AGGAA. For additional information, contact: Bento Soares,

UI-E-CK1 is a normalized CDNA library containing the
following tissue(s): Retina Foveal and Macular. The
library was constructed according to Bonaldo, Lennon and
Soares, Genome Research, 6:791-806, 1996. First strand
cDNA synthesis was primed with an oligo-dT primer
containing a Not I site. Double stranded cDNA was ligated
to an EcoR I adaptor, digested with Not I, and cloned
directionally into pT773-pac vector. The oligonucleotide
used to prime the synthesis of first-strand cDNA contains
a library tag sequence that is located between the Not I
site and the (dT)18 tail. The sequence tag for this
library is GTCC. This library was created for the program,
Gene Discovery in the Visual System, supported by National
Eye Institute (NEI)."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /clome_lib="s9sNU601"
//note="forgan: Stomach; Vector: pME18-FL3; Site_1: XhoI;
/inote="forgan: Stomach; Vector: pME18-FL3; Site_1: XhoI;
Site_2: XhoI; The poly (A) + RNA was dephosphorylated with
bacterial alkaline phosphatase (BAP) and then decapped
with tabacco acid pyrophosphatase (TAP). The decapped
intact mRNA was ligated with DNA-RNA linker including Sfil
site by treatment of T4 RNA ligase and the first strand
cDNA was synthesized with Superscript II using Sfil
oligo-dT primer. After first strand synthesis, RNA was
degraded by NaOH treatment and cDNA was amplified by PCR
reaction. The PCR products were digested with Sfil and
cloned into DraIII- digested pME18S-FL3 vector. The
obtained cDNA vectors were used for transformation of
compsetent cells E. coli ToplOF' by electroporation method.
The cDNA libraries constructed by this method are
                                                                                                                                                                                                                                                                                         e is available at CHGC in Shanghai.

a modified polylinker, Site_1: Not I; Site_2: Eco RI;
Equal amounts of plasmid DNA from three normalized
libraries (fetal lung NbHL19W, testis NHT, and B-cell
NCI_CGAP_GCB1) were mixed, and ss circles were made in
vitro. Following HAP purification, this DNA was used as
tracer in a subtractive hybridization reaction. The driver
was PCR-amplified cDNAs from pools of 5,000 clones made
from the same 3 libraries. The pools consisted of
I.M.A.G.E. clones 297480-302087, 682632-687339,
726408-728711, and 729096-7319. Subtraction by Bento
Soares and M. Fatima Bonaldo. "

/note="Organ: Liver; Vector: pCNS-D2; Site 1: EcoRI; Site 2: NotI; The poly (A) + RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intact mRNA was ligated with DNA-RNA linker including EcoRI site by treatment of T4 RNA ligate and the first strand cDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt. The cDNA vector was circularized with E. coli DNA ligates after digestion of EcoRI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coli ToplOF by electroporation method. The cDNA libraries constructed by this method are full-length enriched cDNA library."

```

```
score greater than or equal to the score of the result being and is derived by analysis of the total score distribution
                                                    is the number of results predicted by chance to have a ster than or equal to the score of the result being printed,

Patent No. 6054289

Patent No. 6054289

GENERAL INFORMATION

APPLICANT: Paul Moore, Reiner Gentz, Hongjin Ji,

APPLICANT: Jian Ni and Jing-Shan Hu

ITILE OF INVENTION: Human Genes, Sequences and

ITILE OF INVENTION: Expression Products

TITLE OF INVENTION: Expression Products
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  US-08-705-771-1

Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for identifying expressed genes or for phase ampping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA. The purified polypeptide is useful for generating antibodies specific for it. The present sequence is one of the 38043 isolated cDNA/EST sequences. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polynucleotide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating

Specifically, it refers to a high combility group I-C protein (HMGI-C) that is associated with obesity and combility group I-C protein (HMGI-C) that is associated with obesity and combility group I-C protein (HMGI-C) that is associated with obesity and combility group I-C protein (HMGI-C) that is associated with obesity and composition describes performing differential gene expression analysis between the white adipose tissue (WAT) or stromal vascular tissue (SVT) compounds that are adipose tissue (WAT) or stromal vascular tissue (SVT) compounds that are adipocyte specific, and as such can be used for preventing adipogenesis, diagnosing and treating diabetes, obesity. These compositions exhibit anorectic, antidabetes or obesity. These compositions exhibit anorectic, antidabetes and human homologue of a murine adipocyte specific DNA sequence is a human homologue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying adipocyte specific genes, useful for treating obesity or diabetes, and for identifying drug targets, by differential gene expression analysis between adipose tissue or stromal vascular tissue mice of different genotypes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 488
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 11; SEQ ID NO 20; 91pp; English.

It was isolated from a breast cancer cDNA library following an EST search for novel genes consisted at ATCC 97175 and ATCC 97885. A gradient and stage specific BCSG1 expression has been demonstrated from virtually no consisted expression in has been demonstrated from virtually no consisted expression in normal or benign breast to low level and partial expression in low grade in situ breast carcinoma and high expression in consistency in the filtrating malignant breast carcinomas. BCSG1 is useful as a breast cancer progression marker. Recombinant vectors and host cells useful for recombinant production of BCSG1 polypeptides (including epitope-bearing polypeptides) are provided. BCSG1 polypeptides, polypeptides and cantibodies can be used for the detection of breast cancer calls or breast cancer metastasis, and to develop methods for the clinical management and treatment of breast cancer.

                                                                                                                                                                                                                                                                                                                                                                                                              ABL63343 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 550 BP; 132 A; 145 C; 192 G; 81 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel polynucleotide (I) encoding human ADA2. The products of the invention have cytostatic activity and can be used for gene therapy. (I) is useful for testing cancer; as primers and probes for isolating full length cDNA and genes having similar biological activity. This sequence encodes a polypeptide derived from the human HBGBA67X clone which is an amyloid-like protein found in breast tissue
                                                                                                                                                                                                                                                                                                                                                              15-MAY-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 2000-338491/29

Screening reening for anti-neoplastic agent involves exposing cells to ent to be tested for anti-neoplastic activity, and determining expression of a gene of a signature gene set. osing cells to a chemical and determining a change

Claim 1; SEQ ID NO 1680; 44pp; English.

The present invention describes a method (M1) for screening for an antineoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in AB161664 to AB170110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, obsophageal, ovarian, kidney, protected or reportation and clear cell prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating lobular cancer, squ cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wi oular cancer, squamous carcinoma and Wilm's

                                                                                                                                                                                                                                                                                                                                       The present sequence is that of cDNA encoding the Glu-110 isoform of human gamma-synuclein. The invention relates to an isoform of gamma-synuclein that is caused by an A/T single nucleotide polymorphism (SNP) at position 329 of the gamma-synuclein coding sequence. This SNP causes glutamic acid to valine change at amino acid position 110 of gamma-synuclein, and is associated with an increased susceptibility of individuals to schizophrenia spectrum disorders (SSDs). This is the first that a genetic component of SSDs has been identified, and provides potential target for diagnosis and treatment of schizophrenia. Gamma-synuclein polypeptides, especially those containing the E110V mutation, are used in a claimed method of screening for compounds useful for the
                                                                                  treatment of SSDs, and gamma-synuclein expressing cells are used in a claimed method of screening for agonist or antagonist compounds. An oligonucleotide complementary to part of the gamma-synuclein coding sequence is used for the discrimination of an SNP at position 329 of the coding sequence. Gamma-synuclein polypeptides or polynucleotides are also useful for the diagnosis of SSDs, or susceptibility to SSDs, e.g. by PCR amplification of a polynucleotide encoding gamma-synuclein and analysis of the occurrence of the SNP at position 329. A transgenic animal useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gamma-synuclein; human; single nucleotide polymorphism; SNP;
